Process For Manufacturing Bags

10

20

Abstract

The invention relates to a process for manufacturing a bag (25, 40) from a polymer and/or metal film material. The lower end of the sack (25, 40) is sealed and has four outer walls (A-D) that are connected by four seams (27).

The novelty and inventive step of said process is that the material (A-E) required for forming the bag is fed in the form of a film tube (25, 40) that is wound up on a roll to an unwinding station of a bottom forming device that separates the unwound film tube into film tube segments and seals at least one end of the bag.
